

# Gemini Cleaning Systems Ltd

## TT-300

**For printers with a print bed up to 490x390x200mm**

## Genie encapsulated washing systems

After working closely with our distributors and their clients own very specific requirements regarding what they actually needed from the washing/finishing part of the 3D printing process their overriding priorities were that they require a machine that is ergonomic for the operators comfort, economic to buy, simple to use, high build quality incorporating industrial high end components, above all reliability and very low maintenance/running costs.

At Gemini we feel that the genie TT-300 machine offers every thing that the end user requires from an entry level table top machine with exhalent value for money whilst still providing you with the very best quality machines capable of dealing with any size prints produced **below** the Stratasys 500 range of printers. We only use Alto motor-pump units, trouble free simple to operate controls, a bright led internal light, tool less nozzle couplings, with a simple internal pressure selection valve, a fixed nozzle point to enable two handed manipulation of the print.

Gemini were the first company to offer the fixed nozzle option as standard, providing you with the very best cleaning option with fantastic control and manipulation of the print.

The two flexible hoses options are unrivalled in allowing you to get into the very deep recess of the print, the 5 mm pipe will go into very long internal channels with ease.

Gemini were also the first company to offer multi function tool less nozzle and flexible hose changing .

**For printers with a print bed up to 490x390x200mm**
